

Manlift Certification Prince George

Manlift Certification Prince George - The Elevated Platforms and Manlifts Certification course helps to provide the necessary training on the work practices, safe operating procedures, rules and regulations regarding the everyday activities for the operators of this machinery. The program has been designed for individuals who are actively involved in these activities or individuals who have a basic knowledge of this equipment.

During the past couple of decades, manlifts and aerial platforms have become a common sight in industrial maintenance applications and on construction job sites. These machinery provide an easy way to lift workers close to what must be done on a stable platform apparatus, allowing employees to perform tasks with greater comfort and safety rather than being perched on top of scaffolding or ladders.

The manlift is like other industrial tools in that they are safe when utilized correctly. As they lift staff above ground level or floor, accidents can happen easily and this could lead to serious fatalities or injuries for both the manlift operators as well as any passerby who may be unlucky enough to be standing beneath.

There are a variety of models of manlifts. Nearly all fall into 1 of 2 categories: the articulating boom lift, that has the capability of both vertical and horizontal movement and the scissors lift, that is capable of moving up and down.

Protecting Staff

Correct training is vital in regard to safety matters. Many of the companies that rent manlifts will provide training at the jobsite. Each and every worker who would be working on the machinery or operating it must receive training in safe operations. It is also essential that only those workers who have received training should be authorized to operate the controls. Communication rules and operating procedures must be clear. Therefore, workers on the ground should not operate controls without the approval and knowledge of any workers inside the basket.

Those staff who will be occupying the basket are required to wear right fall protection like for instance lanyard and a harness. That protection should be connected to the manlift itself and not to a surface nearby. The worker should ensure that he or she has made whatever adjustments needed to reflect the change in fall distance if there are changes in the height of the work area.

Manlifts should be inspected and tested every day to make certain they are in safe operating condition. Prior to utilizing the machinery, whatever defects should be re-checked and fixed.
